

WTC 7 = impossible Rubble

Consider These Observations:

- 1 Most of the rubble from the implosion ended up in this neat pile — **centered within the original footprint**.

debris centered within building footprint

- 2 The 47-story steel-framed **structure was dismembered** and reduced to a small pile only a few stories high.
- 3 **The destruction was complete.** No portion of the building was left standing.
- 4 Most of the **walls collapsed inward** — an unmistakable sign of a controlled demolition implosion.
- 5 **Hot spots in the rubble**, detected by NASA infrared imaging, persisted for weeks at temperatures far exceeding normal office fires.

evidence of melted steel

- 6 **Evidence of melted steel** and “severe high temperature erosion” documented in Appendix C of FEMA report. Further analysis reveals the signature of thermite — an incendiary that creates molten metal.
- 7 **Numerous credible witnesses** confirm several tons of molten metal in the debris “flowing like lava.”

No steel-framed high-rise building has ever collapsed from fire.
